

PROJECT DESIGN PHASE-II

CUSTOMER JOURNEY MAP

Date	28 September 2026
Team ID	_____
Project Name	Import Data using Transform Maps
Maximum Marks	4 Marks

SCENARIO

Importing structured employee data from an external spreadsheet into ServiceNow, transforming the data into the Employee Test table, validating the result, preventing duplicates with Coalesce, and reviewing the imported data through reports and a dashboard.

Journey Scope

This journey follows the documented project process from preparing the spreadsheet through data import, transformation, validation, duplicate handling, reporting and dashboard review.

CUSTOMER JOURNEY MAP — IMPORT DATA USING TRANSFORM MAPS

Steps	Interactions	Goals & Motivations	Positive Moments	Negative Moments	Areas of Opportunity
1. Prepare Spreadsheet	Create Google Spreadsheet and enter sample employee data. Download it as an Excel file. Touchpoints: Spreadsheet / Excel file	Get the employee data ready for import.	Easy to prepare structured data.	Incorrect or incomplete source data can affect later steps.	Provide a clear spreadsheet template and validate required fields before upload.
2. Create Custom Table	Create Employee Test table and configure Employee ID, Employee Name, Email, Department and Location. Touchpoints: ServiceNow table form and Form Layout	Create the target structure for employee records.	Having defined fields makes the target data structure clear.	Creating each field manually can take time.	Provide a standard target-table setup checklist.
3. Load Import Set	Use Load Data to create/use Employee Import and load the spreadsheet into the Import Set table. Touchpoints: ServiceNow Load Data / Import Set	Move spreadsheet data into the staging area without directly changing the target table.	The Import Set provides a separate staging step.	Incorrect table or source-file selection may cause import problems.	Show source and target information clearly before submission.
4. Create Transform Map	Create Sample Spreadsheet Import, select Employee Import as source and Employee Test as target, then map fields. Touchpoints: Transform Map / Mapping Assist	Map source fields correctly to target fields.	Auto Map and Mapping Assist simplify field mapping.	Wrong mappings can place values in incorrect target fields.	Use consistent field names and verify every source-target mapping.
5. Transform & Validate	Run Transform and verify that records are created in Employee Test. Touchpoints: Transform action / Employee Test table	Confirm that imported records are successfully created.	Success status provides confirmation of the transformation.	A failed transformation requires checking the configuration and source data.	Use a validation checklist after every transformation.
6. Enable Coalesce	Set a field such as Employee ID as Coalesce so existing records can be updated instead of duplicated. Touchpoints: Transform Map Field Maps / Coalesce	Avoid duplicate employee records during repeated imports.	Existing records can be identified using the selected field.	Choosing an unsuitable field can affect update behavior.	Use a stable unique identifier such as Employee ID.
7. Insert New Excel Data	Load additional Excel rows, run the existing Transform Map and review inserted, updated and ignored rows. Touchpoints: Load Data / Transform History	Understand how new and existing records are handled.	Transform History shows the result of the import.	Repeated or unchanged data may be ignored, requiring result verification.	Review Transform History after every import.
8. Reports & Dashboard	Create Employees by Department, Employees by Location and Employee List Report, then add them to Employee Analytics Dashboard. Touchpoints: ServiceNow Reports / Dashboard	View employee data and import-related results centrally.	Charts and lists make the imported data easier to review.	Reports must be configured with the correct table and fields.	Keep report names, group-by fields and dashboard layout consistent.

ENTER → ENGAGE → EXIT → EXTEND

ENTER	ENGAGE	EXIT	EXTEND
Prepare spreadsheet and create the target Employee Test table.	Load data, create Transform Map, map fields and run the transformation.	Validate Employee Test records and review Transform History.	Use Coalesce for repeat imports and monitor data through reports and dashboard.

Overall Positive Moments

- Import Set provides a staging area before data reaches the target table.
- Auto Map Matching fields and Mapping Assist support field mapping.
- Transform status and Transform History help verify import results.
- Coalesce supports updating existing records instead of inserting duplicates.
- Reports and Dashboard provide centralized visibility into employee data.

Overall Negative Moments

- Source spreadsheet errors can affect the import.
- Incorrect source-target mapping can produce incorrect target values.
- Repeated imports require checking Transform History to understand inserted, updated or ignored records.
- The project document does not specify automated validation before transformation.

Areas of Opportunity

- Standardize the spreadsheet template and required fields.
- Use a stable unique field such as Employee ID for Coalesce.
- Add a consistent validation checklist after every transformation.
- Maintain standardized reports and dashboard views for ongoing monitoring.

Source Basis

The journey map above is derived from the documented Import Data using Transform Maps workflow. The Customer Journey Map template supplies the journey-map organization (Steps, Interactions, Goals & Motivations, Positive Moments, Negative Moments and Areas of Opportunity); the project-specific activities and terminology come from the Import Data document.
