

PROJECT DESIGN PHASE

PROPOSED SOLUTION TEMPLATE

Project Name: Import Data using Transform Maps (Spreadsheet)

S.No. Parameter	Description
1. Problem Statement (Problem to be solved)	Employee data is received in Excel/spreadsheet format and needs to be entered into ServiceNow. Manual data entry takes time and may cause duplicate or inconsistent employee records. A systematic way is required to import, update and validate employee data efficiently.
2. Idea / Solution description	The project uses ServiceNow Import Sets and Transform Maps to import employee data from a spreadsheet. The spreadsheet is loaded into an Import Set table, source fields are mapped to the Employee Test target table, and the data is transformed. Coalesce is enabled on Employee ID to identify existing records and avoid duplicate entries. Reports and an Employee Analytics Dashboard are created to monitor the imported employee data.
3. Novelty / Uniqueness	The solution combines spreadsheet data import, field mapping, automated transformation and Coalesce-based duplicate prevention in one ServiceNow workflow. Reports and a dashboard provide a centralized view of employee information after the import.
4. Social Impact / Customer Satisfaction	The solution reduces manual data-entry effort for HR and ServiceNow administrators, helps maintain cleaner employee records and makes employee information easier to monitor through reports and dashboards. It can improve the user experience by making bulk employee data handling more organized.
5. Business Model (Revenue Model)	This project is an internal enterprise data-management solution rather than a direct revenue-generating product. It can be used by organizations as part of their ServiceNow HR/data-management operations to reduce manual effort and improve data quality.
6. Scalability of the Solution	The same Import Set and Transform Map approach can be extended to larger employee datasets and additional fields. More reports, dashboards and data sources can be added as organizational requirements grow. Coalesce can continue to help identify existing records during repeated imports.

Project Flow: Spreadsheet → Import Set → Transform Map → Field Mapping → Employee Test Table → Coalesce → Reports → Employee Analytics Dashboard
